489 Quality Evaluation of Allergen Immunotherapy Guidelines Worldwide Using AGREE-II

Desiree E. S. Larenas Linnemann, MD, FAAAI1, Dario Antolini-Amerigo, MD2, Alla Nakonechna, MD, PhD3, Ignacio Davilla-Gonzalez, MD, PhD4, Maximiliano Gomez, MD, PhD5, Michael Lev1, MD6, Claudio Parisi7, Jose Antonio Ortega Martell, MD8, Jorge A. Luna-Pech, MD9, Betina Wedi, MD, PhD10, Ludger Klimeck, MD, PhD11, Nelson A. Rosario, MD, PhD, FAAAI12 and Olivier Pfarr, MD, PhD13, Hospital Medica Sur, Mexico City, Mexico, Hospital Universitario Principe de Asturias, Alcalá de Henares, Spain, Royal Liverpool University Hospital, Liverpool, United Kingdom, University Hospital of Salamanca, Salamanca, Spain, Fundación Ayre (Education & Research), Salta, Argentina, University of Cape Town, Red Cross Children's Hospital and School of Adolescent and Child Health, Cape Town, South Africa, Hospital Italiano, De Buenos Aires, Argentina, Universidade Autónoma do Estado de Hidalgo, Pachuca, Hidalgo, Mexico, Universidad de Alergia e Immunología, Guadalajara, Jalisco, Mexico, Hannover Medical School, Hannover, Germany, Center for Rheumatology and Allergy, Wiesbaden, Germany, Federal University of Paraíba, Curitiba, Brazil, Departament of Otorhinolaryngology, Head and Neck Surgery, Universitätsmedizin Mannheim, Mannheim, Germany.

Rationale: Since 1988 numerous AIT-guidelines (AIT-GLs) have been developed by national and international organizations to guide physicians in AIT. Even so, AIT is still severely under-used. AGREE-II was developed in 2010 by Mc Master university methodsologists to evaluate guideline quality.

Methods: The project team consisted of allergists, knowledgeable in AIT, trained in AGREE-II, with methodology’s guidance. AIT-GLs in any language were sought from 1980–2015 in Medline, Embase and contacting local AIT experts; AIT-GLs were evaluated by 2 independent reviewers; discrepancies were resolved in a 2nd round, by team-discussion or methodologies’ consulting.

Results: We found 31 AIT-GLs (16 post-2010), ranging from local consensus reports to international position papers (EAACI, AAAAI-ACAAI, WAO). Pre-2010 GLs’ score ranged 1.6-5.2/7 and post-2010 GLs 1.6-6/7. The best evaluations went to the German AIT-GL (6.0) followed by the AAAAI-ACAAI (5.2) and the Mexican GL (5.1). These were the also the only 3 GLs that received ‘yes’ of both evaluators to the last item: ‘I would recommend this GL for use’. The domains of stakeholder involvement and Rigo of Development only scored 3/7, but Domain ‘Applicability’ scored the lowest. Strikingly, newer guidelines only scored better in ‘Editorial Independence’ and ‘Global evaluation’.

Conclusions: In AIT-GLs there is still a lot of room for improvement, especially in two domains, crucial in dissemination (stakeholder involvement and applicability). For some the ‘Scientific rigor’ domain flawed. In situations with limited resources, transrating a high-quality existing GL might be appropriate. AGREE-II could help to pick quality candidate GLs for such procedure.

490 Reduction in the need of inhaled corticosteroids in children with asthma receiving allergen specific immunotherapy

Carlos Macouzet-Sanchez, MD, Sandra González-Díaz, MD, PhD, AAAAI, Alfredo Arias Cruz, MD, AAAAI, Alejandro Macias-Weinmann, MD, Jose Antonio Buenfil-Lopez, MD, Alma Belen Paruiu-Ortega, MD, Olga Patricia Monge-Ortega, MD, Lissette Ramos-Valencia, MD, and Jesus Arturo Ibarra-Chaves, MD; UANL Allergy and Clinical Immunology Regional Center, Monterrey University Hospital, Monterrey, Mexico.

Rationale: One of the described benefits of allergen specific subcutaneous immunotherapy (SCIT) is its potential effect on the reduction of the medication needed for the treatment of allergic diseases. Our aim is to assess the reduction of inhaled corticosteroids (ICS) in children under SCIT.

Methods: A retrospective study was conducted, obtaining data from asthma patients’ medical records of a regional allergy center in Monterrey, Mexico, from March 2015 to March 2016. Two age groups were considered and ICS was reviewed before and after six months after starting SCIT.

Results: 169 patients were included. In the first group (N=128; 5-11 years old), 57.8% were treated with SCIT of which 37.8% never used ICS. From the patients (42.2%) who used ICS, 14.8% continued them and 41.9% quit them 6 months after the SCIT onset (p=0.24). The proportion of patients who discontinued ICS after 6 months was higher in the group receiving SCIT (p=0.022). In the second group (N=41; 12-18 years old), 73.2% were treated with SCIT, 73.3% of the patients used ICS, of which 16.6% continued them and 56.5% discontinued them 6 months after the SCIT onset (p=0.29). There was no difference between patients under SCIT with ICS and the patients who discontinued them (p=0.48). Other allergic comorbidities found were: allergic rhinitis (AR) (92.3%), AR and atopic dermatitis (AD) (6.5%), AR and food allergy (0.6%), and AD (0.6%).

Conclusions: Reduction in the need for ICS was higher in children under 11 years old receiving SCIT compared with patients who did not receive it.

491 Symbiotic and the Possible Increase of T Helper 1 Cells during Subcutaneous Immunotherapy for Allergic Rhinitis

Nasrin Mozaffen, MD, Farahzad Jabbari, Hamid Ahanchian, MD, and Reza Farid, MD, AAAAI; Mozghan Mohammad and Maryam Khoshkhoy, Allergy research center, Mashhad university of medical science, Mashhad, Iran (Islamic Republic of).

Rationale: Investigation the synergistic effect of symbiotic in clinical and immunologic efficacy of subcutaneous allergen immunotherapy in allergic rhinitis patients.

Methods: Twenty- eight individuals aged between 5-55 years with allergic rhinitis were enrolled in a double blind, placebo controlled study. All patients who met the eligibility criteria were randomly divided into three groups: A) Immunotherapy + symbiotic, B) Immunotherapy + placebo and C) just symbiotic. Group A and C participants received 1 symbiotic capsule per day during the first two months of treatment. Participants underwent clinical and laboratory assessment in week 8, and at the end of intervention, month 6.

Results: improvement in symptom score and quality of life were occurred in all groups, yet there was no significant difference between groups A vs. B (P value = 0.25) after 6 months of treatment and neither between groups A vs. C (P value = 0.25) after 2 month of treatment. In immunologic parameters, there were significant enhancement in T helper type 1 cell percentage in group A rather than group B (P value = 0.022) and also in group A rather than group C (P value = 0.023). There was also no significant difference between groups B vs. C (P value = 0.85).

Conclusions: in this study we conclude that adding symbiotic to SCIT increase TH1 cells percentage although this effect is temporary: there was no significant statistically difference in clinical response among the groups. Future studies with large sample size could possibly make this difference statistically significant.
